Questions & Answers About respiratory physiology the essentials by john b west 9th ninth revised edition 2011

No	Question	Answer
1	What are the key differences between static and dynamic lung compliance as discussed in West's 'Respiratory Physiology'?	Static compliance measures the lung's ability to expand without airflow, assessed during a pause in ventilation, reflecting elastic properties. Dynamic compliance includes airway resistance, measured during actual airflow, and can be affected by airway narrowing or obstruction.
2	How does West explain the concept of ventilation-perfusion (V/Q) matching in the lungs?	West describes V/Q matching as the process where ventilation (air flow) and perfusion (blood flow) are optimally balanced to maximize gas exchange efficiency. Discrepancies lead to shunting or dead space, affecting oxygenation and CO ₂ removal.
3	What role does the alveolar-arterial oxygen gradient play in respiratory physiology according to West?	The alveolar-arterial oxygen gradient indicates the efficiency of oxygen transfer from alveoli to blood. An increased gradient suggests issues like ventilation-perfusion mismatch, diffusion impairment, or shunt, as detailed in West's explanations.
4	How is the Haldane effect described in West's 'Respiratory Physiology'?	The Haldane effect refers to the increased capacity of deoxygenated blood to carry carbon dioxide. West explains that oxygenation of blood in the lungs reduces CO ₂ capacity, facilitating CO ₂ release from tissues.

5	What mechanisms does West highlight that regulate the control of breathing?	West emphasizes the roles of central chemoreceptors responding to CO ₂ and pH levels, peripheral chemoreceptors sensitive to O ₂ , and neural inputs from higher brain centers, all coordinating to maintain respiratory homeostasis.
6	In West's book, how is the concept of dead space ventilation explained?	Dead space refers to portions of the respiratory pathway where no gas exchange occurs. West describes anatomical dead space (conducting airways) and alveolar dead space (alveoli that are ventilated but not perfused), affecting overall ventilation efficiency.
7	What insights does West provide about the oxygen dissociation curve and its clinical significance?	West explains the sigmoidal shape of the oxygen dissociation curve, illustrating how factors like pH, temperature, CO ₂ , and 2,3-BPG shift the curve, affecting hemoglobin's oxygen affinity and tissue oxygen delivery.
8	How does West describe the mechanics of the respiratory muscles during inspiration?	West details how the diaphragm and external intercostal muscles contract during inspiration, increasing thoracic volume and creating negative pressure, which facilitates airflow into the lungs.
9	What is the significance of the Bohr and Haldane effects in the context of respiratory physiology, as explained by West?	The Bohr effect describes how increased CO ₂ and decreased pH reduce hemoglobin's oxygen affinity, promoting oxygen release to tissues. The Haldane effect explains how oxygenation of blood reduces CO ₂ capacity, facilitating CO ₂ unloading in the lungs.
