Understanding the Full Moon: A Celestial Overview

A full moon occurs when the Earth is positioned directly between the Sun and the Moon, illuminating the lunar surface completely from our vantage point on Earth. This phase is one of the most striking and easily recognizable events in the lunar cycle, occurring approximately once every 29.5 days.

The Lunar Cycle and Its Phases

The lunar cycle, or lunation, encompasses several phases: - New Moon: The Moon is between Earth and the Sun, making it nearly invisible. - Waxing Crescent: A sliver of the Moon becomes visible, growing toward fullness. - First Quarter: Half of the Moon is illuminated, often called a "half-moon." - Waxing Gibbous: More than half is illuminated, approaching full moon. - Full Moon: The entire face of the Moon is visible and fully illuminated. - Waning Gibbous: The illumination decreases after full moon. - Last Quarter: Again, half of the Moon is visible, but opposite side illuminated. - Waning Crescent: A decreasing sliver before returning to the new moon phase. This cycle repeats approximately every 29.5 days due to the complex
