

Immobilised Enzymes A Level Biology Practical

Immobilised enzymes A level biology practical Understanding the concept of immobilised enzymes is fundamental to many practical applications in biology, particularly at the A level. Immobilised enzymes are enzymes that are attached to or confined within a solid support, allowing them to catalyse reactions without being lost in the process. This technique is widely used in laboratory experiments and industrial processes due to its advantages such as reusability, stability, and ease of separation from products. In this article, we will explore the practical aspects of immobilised enzymes in a level biology context, including their preparation, applications, and the methodology of typical experiments.

What Are Immobilised Enzymes?

Immobilised enzymes are enzymes that have been fixed onto a solid support or trap within a matrix, preventing their diffusion away from the reaction site. Unlike free enzymes that are dissolved in solution, immobilised enzymes offer several practical benefits:

- Reusability: They can be used multiple times without the need for replenishing enzyme supply.
- Enhanced stability: Immobilisation often increases enzyme stability against pH and temperature changes.
- Ease of separation: Facilitates straightforward separation of enzymes from reaction products.
- Controlled reaction conditions: Allows for better control over reaction parameters.

Preparation of Immobilised Enzymes in the Laboratory

Preparing immobilised enzymes for practical experiments involves several key steps. These steps are essential for ensuring the enzyme remains active and is effectively immobilised.

Materials Required

- Enzyme solution (e.g., amylase, catalase) - Solid support material (e.g., alginate beads, glass beads, cellulose) - Cross-linking agents (e.g., glutaraldehyde) - Buffer solutions (e.g., phosphate buffer) - Equipment: syringe, beakers, stirring rod, water bath, pipettes, filtration apparatus

Common Methods of Immobilisation

1. Encapsulation in Beads: - Enzymes are trapped within a gel matrix such as sodium

alginate. - Procedure: - Mix enzyme solution with sodium alginate. - Drop the mixture into a calcium chloride solution to form beads. - Rinse the beads thoroughly before use. 2. Adsorption: - Enzymes are adsorbed onto the surface of a solid support via physical forces. - Simple but less stable over time. 3. Covalent Bonding: - Enzymes are linked covalently to the support using cross-linking agents like glutaraldehyde. - More stable and suitable for industrial applications. 4. Cross-Linking: - Enzymes are linked together using bifunctional agents, forming insoluble aggregates.

Designing a Practical Experiment Using Immobilised Enzymes

A typical A level biology practical involves investigating enzyme activity using immobilised enzymes. Here is a step-by-step guide to designing such an experiment.

Objective

To measure the activity of an immobilised enzyme (e.g., amylase) by observing the breakdown of substrate (e.g., starch) over time.

Variables

- Independent variable: Temperature, pH, enzyme concentration - Dependent variable: Rate of reaction (e.g., amount of starch broken down, amount of product formed) - Controlled variables: Substrate concentration, incubation time, volume of enzyme used

Methodology

1. Preparation of Immobilised Enzymes: - Use the encapsulation method to prepare enzyme beads. - Ensure consistent size and enzyme loading for reproducibility. 2. Setting Up the Reaction: - Place the immobilised enzyme in a beaker containing starch solution. - Incubate at different temperatures or pH levels as required. - Use a water bath to maintain temperature. 3. Sampling and Testing: - At regular intervals, remove a sample of the reaction mixture. - Use iodine solution to test for starch presence: - Blue-black indicates starch. - No color change indicates starch has been broken down. 4. Data Collection: - Record the time taken for starch to be completely broken down. - Alternatively, measure the amount of reducing sugars produced using Benedict's test or DNS assay. 5. Analysis: - Plot reaction rate against temperature or pH. - Determine the optimal conditions for enzyme activity.

Advantages of Using Immobilised Enzymes in Practical

Experiments

- Reusability: Immobilised enzymes can be used repeatedly, reducing costs. - Stability: They are often more resistant to denaturation. - Ease of separation: Simplifies product purification. - Controlled reactions: Better regulation of reaction conditions.

Limitations and Challenges

While immobilised enzymes offer many benefits, there are some limitations: - Reduced activity: Immobilisation can sometimes reduce enzyme activity due to structural constraints. - Mass transfer limitations: Substrate diffusion to the active sites may be hindered. - Cost: Preparation of immobilised enzymes may be more expensive than free enzymes. - Stability issues: Over time, immobilised enzymes may lose activity due to leaching or structural changes.

Applications of Immobilised Enzymes

The practical use of immobilised enzymes extends beyond classroom experiments: - Industrial processes: Production of high-fructose corn syrup, lactose-free milk, and biofuels. - Medical applications: Enzyme-based biosensors and drug delivery systems. - Environmental: Wastewater treatment using immobilised enzymes to break down pollutants.

Summary of Key Points for A Level Practicals

- Proper immobilisation techniques are crucial for successful experiments. - Consistent bead preparation ensures reproducible results. - Testing enzyme activity involves monitoring substrate breakdown over time. - Data should be carefully recorded and analyzed to determine optimal conditions. - Awareness of limitations helps in designing better experiments.

Understanding Enzyme Immobilisation

What Are Immobilised Enzymes?

Immobilised enzymes are enzymes that have been physically confined or localized onto or within a solid support matrix, allowing them to be separated from the reaction mixture easily and reused multiple times. Unlike free enzymes, which are suspended freely in solution, immobilised enzymes maintain their catalytic activity while being anchored, which can profoundly affect their stability, specificity, and operational efficiency. Common methods of enzyme immobilisation include:

- Adsorption: Enzymes are adsorbed onto the surface of carriers via weak interactions such as Van der Waals forces or hydrogen bonds.
- Covalent Bonding: Enzymes are covalently linked to the support, providing strong attachment that minimizes enzyme leaching.
- Entrapment: Enzymes are confined within a gel or polymer matrix, such as alginate beads.
- Encapsulation: Enzymes are enclosed within semi-permeable membranes or capsules.

Principles Behind Immobilised Enzyme Practical

Objective of the Practical

The primary goal of an immobilised enzyme practical at A Level is to investigate how immobilisation affects enzyme activity under various conditions and to compare it with free enzyme systems. Typical objectives include:

- Measuring enzyme activity with immobilised versus free enzymes.
- Exploring the effects of temperature, pH, substrate concentration, or inhibitors.
- Demonstrating enzyme reusability and stability.
- Understanding kinetics and calculating parameters such as V_{max} and K_m .

Core Concepts

- Enzyme kinetics: How the rate of reaction varies with substrate concentration. - Enzyme stability: The ability of immobilised enzymes to retain activity over time or under different conditions. - Reusability: The potential to recover and reuse immobilised enzymes, reducing costs. - Mass transfer: The movement of substrate and product molecules to and from the enzyme active site, which can be affected by immobilisation.

Methodology of an Immobilised Enzyme Practical

Designing the Experiment

A typical immobilised enzyme practical involves several key steps: 1.
